INDIVIDUAL PROJECT

Body Language Assistant

A research-driven interface for interpreting nonverbal behavior

Hello, everyone ✨

Mahek Merchant

Research Engineer at Nanyang Technological University, Singapore

Working on solar panel regeneration

What is the Problem you are solving?

Body language can be easily misinterpreted

- Lack of accessible research tools
- Risk of hallucinated responses from AI
- Body language cues are situation-based

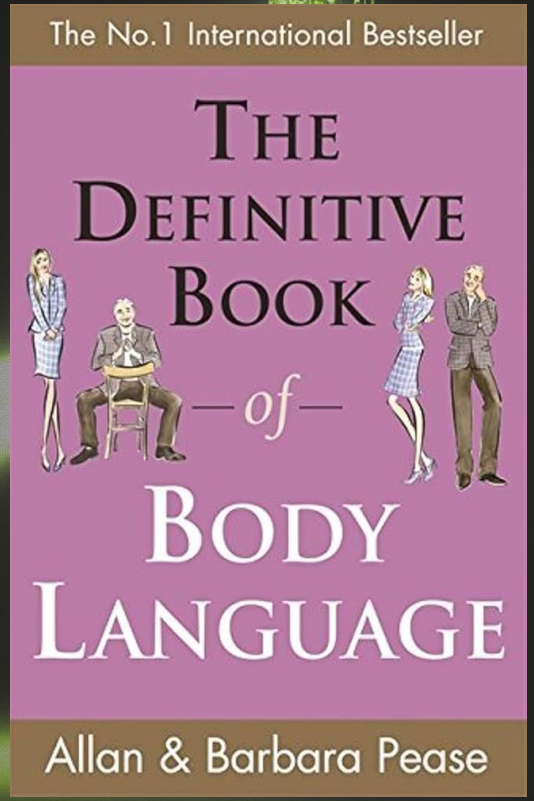
How are you solving the problems?

A **research-driven** body language interpretation assistant

Declines requests unrelated to body language

Grounds answers in credible literature

Accesses the web for latest research



Target Audience

Target Audience (Primary)

Students & learners interested in communication and behavioral psychology

Psychology students, public-speaking trainees, people improving interpersonal skills

Target Audience (Secondary)

Professionals who analyze or rely on interpersonal communication

HR professionals, educators, criminal investigators (for observation, not decision-making)

Book knowledge + Web search

Interpret the body language in this image.

What does crossed arms and averted gaze usually suggest?

What is the latest research on microexpressions?

IMAGE UPLOAD GUIDANCE

Supported formats: .jpg, .jpeg, .png
Use a clear image with visible face, hands, and posture where possible.
Avoid heavily cropped, blurred, or low-light images.

YOU

Interpret the body language in this image.

ASSISTANT

The individuals in the image appear engaged and open in their communication. Their posture, leaning slightly forward with relaxed shoulders and facing the center of the table, suggests attentiveness and involvement in the group's discussion. The open hands with slightly upward-facing palms and spread fingers are classic conversational gestures, indicating a willingness to share and engage. The act of holding a pen and appearing ready to write further reinforces the idea of active participation and a desire to record or contribute ideas.

YOU

What is the latest research on body language?

ASSISTANT

Research indicates that facial expressions and body movements can accurately determine human emotions [C1]. Studies also highlight the complexity of interpreting body language and the need for further research into the interaction between facial and body cues [C2]. Nonverbal cues, including body language, are vital for communicating understanding [C4]. Social psychologists are studying how the body and nervous system interact with social dynamics, focusing on nonverbal communication, power, and trust [C3].

What does the body language of cigarette smokers convey?

ASSISTANT

The body language associated with smoking can offer insights into a person's emotional state and intentions. The ritualistic actions involved in smoking, such as tapping, twisting, flicking, and waving the cigarette, often indicate heightened tension. Smokers may use the act of smoking to stall decision-making, particularly during tense negotiations. Furthermore, the direction in which smoke is exhaled can signal a decision: blowing smoke upwards suggests a positive decision, while blowing it downwards indicates a negative one. Social smokers, in particular, use smoking as a display to create specific impressions on others, with a significant portion of their smoking time dedicated to gestures and rituals rather than actual smoking. Women may use the cigarette as a social display to open their bodies and expose their wrists, while men tend to keep their bodies closed and their wrists straight when smoking.
